The sample shall be soldered onto the printed circuit board in figure 1 and a load applied until the figure in the arrow direction is made approximately 3mm.(keep time 30 seconds) PCB dimension shall the page 7/9 <div style="text-align: center; margin-top: 20px;">  <p>PRESSURE ROD figure-1</p> </div>
Vibration	$\Delta L/L_0 \leq \pm 5\%$ There shall be no mechanical damage.	The sample shall be soldered onto the printed circuit board and when a vibration having an amplitude of 1.52mm and a frequency of from 10 to 55Hz/1 minute repeated should be applied to the 3 directions (X,Y,Z) for 2 hours each. (A total of 6 hours)
Solderability	New solder More than 90%	Flux (rosin, isopropyl alcohol{JIS-K-1522}) shall be coated over the whole of the sample before hard, the sample shall then be preheated for about 2 minutes in a temperature of 130~150°C and after it has been immersed to a depth 0.5mm below for 3±0.2 seconds fully in molten solder M705 with a temperature of 245±5°C. More than 90% of the electrode sections shall be covered with new solder smoothly when the sample is taken out of the solder bath.

Resistance to Soldering heat (reflow soldering)	<p>There shall be no damage or problems.</p>  <p>The graph shows Soldering temperature (°C) on the y-axis (0 to 300) and time on the x-axis. The pre-heating phase rises from ~40°C to a plateau between 150°C and 180°C over 2 minutes. The soldering phase rises sharply to a peak of 260±3°C in 10 seconds, maintaining a minimum of 230±0°C for 30 seconds.
